

## ABSTRACT

A simple inexpensive one-piece device to aid one in acquiring the seatbelt within a motor vehicle. This one-piece flexible device is meant to be temporarily or permanently attached above the male member of the seatbelt buckle. The attachment may be accomplished with a snap on method as seen in this preferred embodiment but may also be done by other methods as will be obvious to those trained in the art. When the seatbelt is in its retracted position a long handle protrudes towards the windshield so that it is visible to the driver or passenger. With either arm the seatbelt can be easily grabbed and pulled across the body to fasten the seatbelt with minimal reaching. This is ideal for persons with back, neck, shoulder and arm pain.
